

Q2. Once the first program is typed, and executed, answer the following questions

- If you try to print a message after the `exec*` call, does it print it? Why? Why not?

if you just call `exec` without parameter then It would not print it, because the `exec*` call are different and separate programs from the testOS code, so the code of the test file will not be run. However, if you call `exec` with parameter it would print.

- Who is the parent of your executable program?

The parent is bash of my executable program.

- How would you change the code so that the child and parent run concurrently?

First, delete the `wait` function. Second, write new code to replace the `exec` function.
